Airia

Airia is an **enterprise AI orchestration platform** that allows organizations to **build, deploy, manage, and govern AI agents at scale**.

It combines three core pillars in a **single unified system**:

Core Capabilities

- **Orchestration** → Build workflows with multiple AI agents
- **Security** → Protect data, enforce policies
- **Governance** → Monitor, audit, and control AI usage

Instead of using multiple tools, Airia provides a **single control center for the entire AI lifecycle**.

Key Features of Airia

1. Agent Builder

- No-code / low-code / pro-code
- Drag-and-drop workflow design
- Natural language agent creation

2. Data Integration

- Connect to enterprise systems (CRM, files, APIs)
- Secure data access with governance

3. Model-Agnostic Platform

- Works with:
    - OpenAI
    - Claude
    - Custom models

4. Workflow Orchestration

- Chain multiple agents
- Build pipelines
- Automate decision-making

5. Security & Governance

- Data protection
- Risk monitoring
- Audit logs

6. Prototyping Studio

- Test agents before deployment
- Sandbox environment

Core Components in Airia

Models

- LLMs like Claude, Nova, etc.
- Used to power agents

Prompts

- Instructions given to models
- Define agent behavior

Tools

- External integrations (APIs, apps)
- Example:
    - Outlook
    - Calculations
    - Web data

MCP Servers

- Advanced tool connections
- Enable structured tool calling

User Prompts

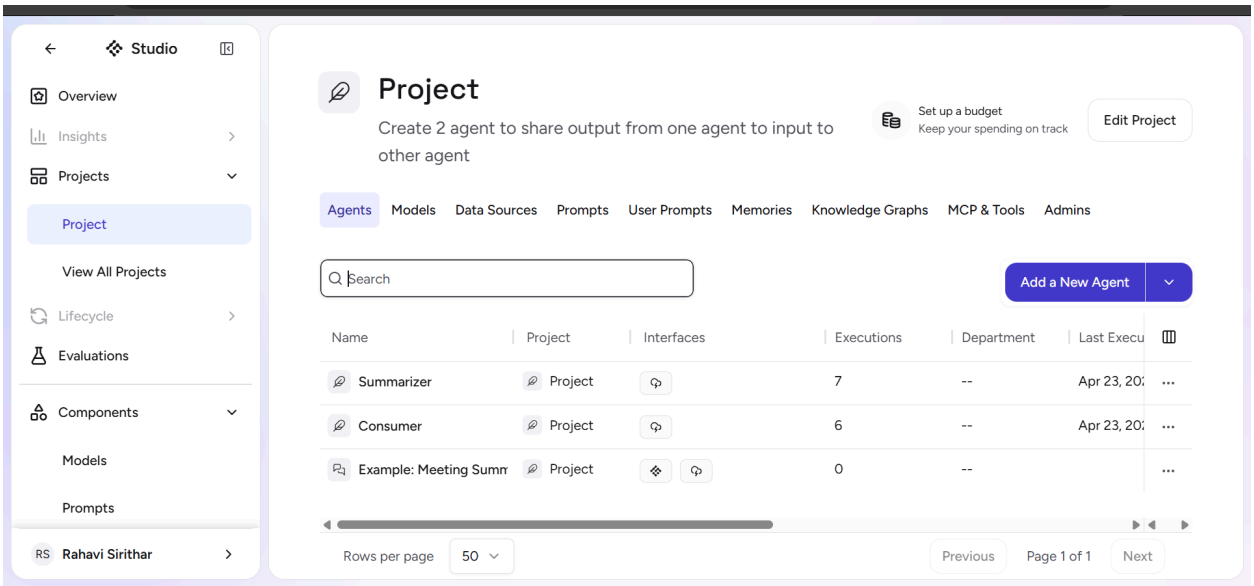
- Input templates for users

Knowledge (Data Sources)

- Files, databases, systems
- Used for context-aware AI

How to create agents ?

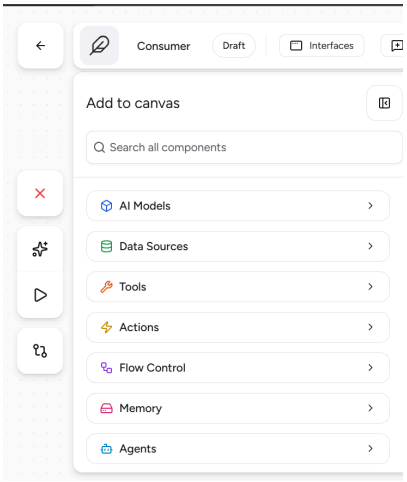
After creating a project under Projects, click the ‘Add a New Agent’ button.

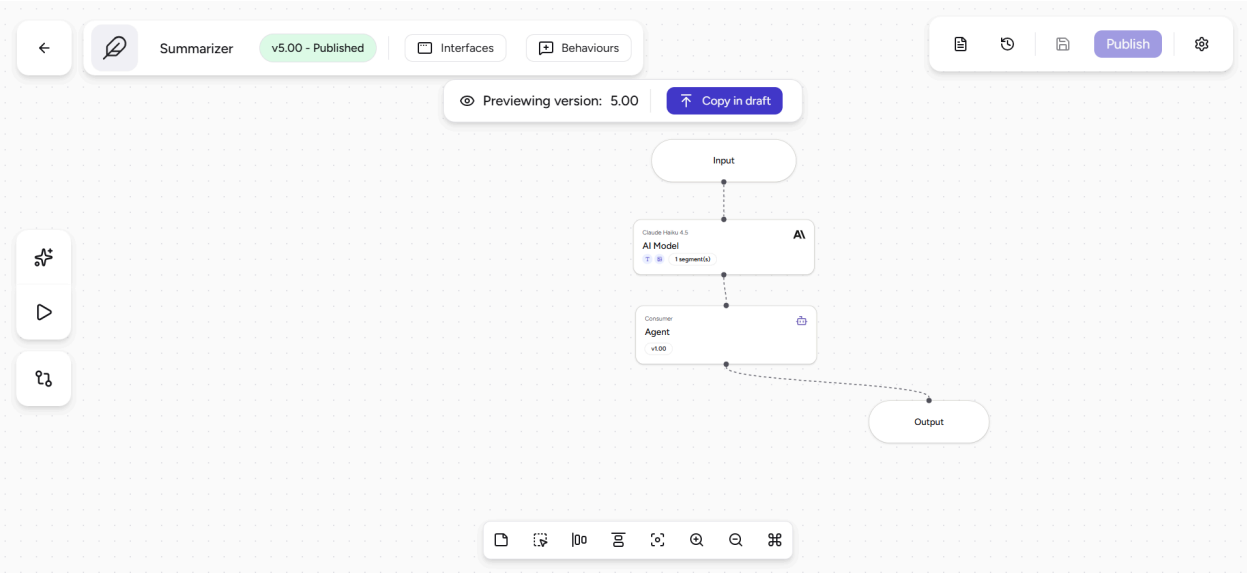


How to connect one agent output to input of another agent ?

Here input can be text, image and video and we can define variables also. When we click AI model we need to give instructions on what it should do.

When we click the “+” icon on the left side we can add any tools or models or agent. That's how the **Consumer** agent added at the **Summarizer** agent.



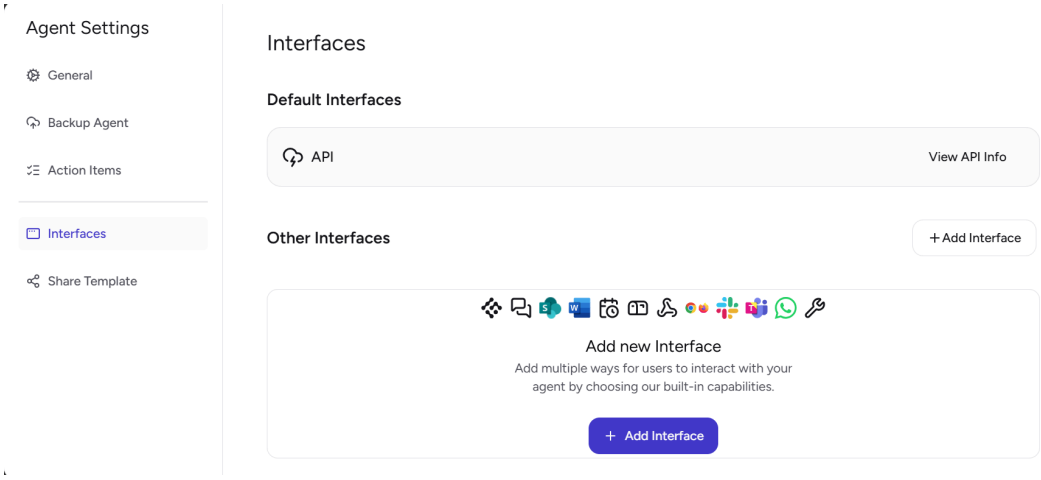


Here the summarizer agent receives **one paragraph**, its AI model selects **3 main topics** from the paragraph and **passes it to the consumer agent as json**. The consumer agent receives them and **passes** those to its AI model and **creates descriptions for those 3** main topics and generates the output.
We can delete connecting lines and change the order and later we can connect.

Interfaces & API Usage

Can expose agents via:

- API
- Chat UI
- Slack / Teams
- Web apps



1. Email Interface

The Email interface enables the agent to receive and respond to emails automatically.

How it works:

- The system provides a unique email address for the agent
- Users send emails to this address
- The agent processes the email using its AI model
- Based on configuration, the agent can:
    - Reply to the sender
    - Reply to all recipients
    - Forward the email
    - Take action without sending a response

Key Configurations:

- **Email Address** → Unique inbox for the agent
- **Email Actions** → Define how the agent responds
- **Domain Restrictions** → Control who can send emails
- **User Mapping** → Map sender email to platform users

2. Microsoft Teams Bot Integration

The Teams Bot allows users to interact with the agent directly within Microsoft Teams chats and channels.

How it works:

- The agent is deployed as a Teams bot
- Users send messages in Teams
- The agent processes the request using its AI model
- The response is returned instantly in chat

Key Configurations:

- **Microsoft Graph Access Token**

    - Required to connect Airia with Microsoft Teams
- **Execution Mode**:
    - **Anonymous** → No user identity
    - **Agent Creator** → Runs as the creator
    - **Airia User** → Maps Teams users to platform users (recommended)
- **Auto User Creation**
    - Automatically creates users when new people interact
