Connecting GitHub & Figma with Lovable

1. Connecting an Existing GitHub Repository to Lovable

Currently, Lovable does **not directly import an existing GitHub repo** in a clean way. However, you can use the following workaround:

Recommended Workaround Method

1. **Create a small project in Lovable -** Generate any basic app using Lovable
2. **Push that project to GitHub -** Use Lovable's GitHub integration to create a new repository
3. **Clone the repository locally**
   - git clone <your-repo-url>
   - cd <repo-name>
4. **Replace the generated code**
   - Delete the existing files inside the repo
   - Add your actual project files (your locally built web app)
5. **Push changes back to GitHub**
   - git add .
   - git commit -m "Replace with actual project files"
   - git push origin main
6. **Lovable sync behavior**
   - Lovable will automatically read files from the **main branch**
   - Your project will now appear inside Lovable
7. **Continue development**
   - You can now:
     - Add new features using Lovable
     - Modify UI/components via prompts

Important Notes

- Always push changes to the **main branch**
- Avoid breaking project structure (Lovable expects a React-based setup)
- Keep backups before replacing files

Can I import an existing GitHub repo into Lovable? ›

Not directly in the usual sense. Connect GitHub to a new Lovable project, select an existing repository, and Lovable will read and work with that code. If you have an old repo with code, you can start a new Lovable project, connect to that repo, and Lovable will sync it. Changes you make in Lovable will push to that repo.

Can I start a project by importing code from an external source such as GitHub? ›

Lovable doesn't support importing existing code as a starting point. Instead, you can remix an existing Lovable project or start from scratch with a prompt. You can later connect a GitHub repo for two-way sync after creating your project.

2. Connecting Figma to Lovable

There are **three ways** to use Figma designs with Lovable:

Way 1: Screenshot-Based Prompt

Steps:

1. Take a screenshot of your design from Figma
2. Upload it into Lovable prompt
3. Describe what you want:
    - Example: *"Create this UI with the same layout and styling"*

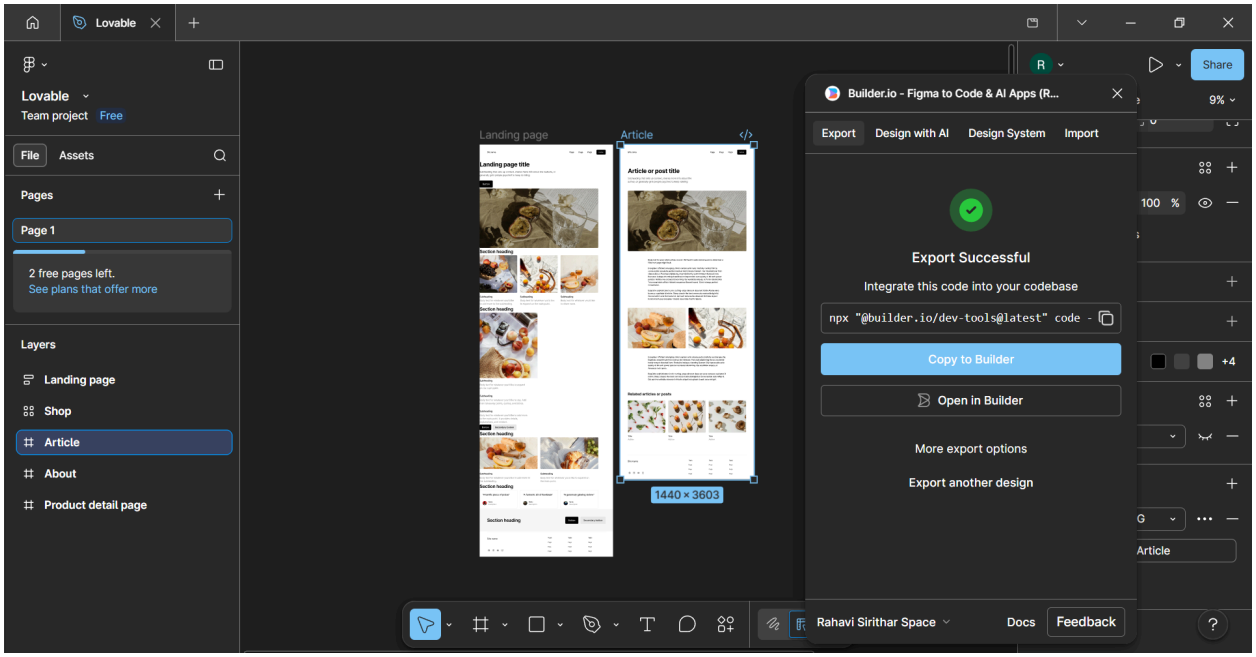
Way 2: Figma → Builder.io → Lovable

Tools involved:

- Figma
- [Builder.io]

Flow:

1. Design UI in Figma
2. Import design into [Builder.io] (Figma Plugin)
3. Export or integrate with Lovable



Here Open in Lovable button should come (In paid versions)

Way 3: Live Figma Access

This is the **most accurate method**.

Steps:

1. Download Lovable Desktop
   https://lovable.dev/download
2. Open Figma Desktop
3. Enable Dev Mode
   - Press: `Shift + D`
4. Enable MCP Server
   - Go to Inspect panel
   - Click **"Enable desktop MCP server"**
5. Connect in Lovable

Go to:
Settings → Connectors → Local MCP servers

   - Connect Figma
6. Share your Figma file again

What happens next?

Lovable will automatically:

- Extract **frames/layouts**
- Read **styles (colors, fonts, spacing)**
- Import **assets (icons, images)**
- Generate **accurate frontend code**
